
Fruit could make 'powerful fuel'

Posted by Rohitpatel - 2007/07/01 19:16

Well this <http://news.bbc.co.uk/1/hi/sci/tech/6224846.stm> suggest that fruit such as apples can be made into a powerful low carbon biofuel but it all depend on the energy cost to extract fructose and convert it to DMF.

What you say?

As we know all energy such these are very costly at the moments but I am sure cost of such a method would be reduce in future once people start using this.

I think that cost is the key. Too much biofuel is scarred by the fact that it costs more energy to extract than the energy that it produces.
