
Reason for 'Global Warming'

Posted by Rohitpatel - 2007/06/28 18:49

Well Global Warming came out because of the disintergration of the O-zone layer and ongoing pollution is only partially to blame for Global Warming. From my own study I found that the Sun itself is getting hotter. Therefore Global Warming is inevitable due to occuring natural change.

I want your comments on my view. I hope someone will agree with me.:)

Like you I feel that some of the problems are being created by Solar flares from the Sun. I have also read that the Earth is shifting on her axis, does anyone have any thoughts on this.

One thing for sure, there are many theories out there, and I for one get a little confused.:)

Well I also heard that Earth is shifting on her axis and may be it causes some problems for us. I know human's activities are reason behind Gloobal worming but Solar is also take part in this.

I think that the stage of global warming is a natural one, just like ice ages are part of the natural cycle. I don't think human beings caused global warming, but I think we're certainly accelerating the process.

Yes we are not make this but we just accelerating the process and it will be creat problem for us. Now people understood it and doing great work agianst Global Warming.

My problem is a bit more prosaic. I am not sure whether humans are responsible for this, but what worries me is the cost of the measures that could do so much more good for things such as providing clean water.

The current temperature raise is debatable. The earth goes through warm and cool periods and it could just be that we are going through a warm period. However, the hole in the Ozone layer is our fault. The UV rays reaching earth are increasing, which is harmful to humans.

Yes, the Earth's temperature does fluctuate in a cyclical manner. However there can be no doubt that we are accelerating the natural process.

The providing of fresh water would not have been such a problem if it were not for our stripping away the natural fauna of the land and replacing it with grazing land for beef and other crops that are use uniquely to us.

Ultimately we brought all of this on ourselves.

We have moved into a "Solar minimum" after years of being in a solar max. Unfortunately I can't remember which of of these tends to raise the earth's surface temperature.

I Think a solar max lowers the earth's surface temperature, though.
